INTERNSHIP REPORT ON

“Frontend development”

UNDERTAKEN AT

Hash Devlopers

SUBMITTED TO M.D. UNIVERSITY (ROHTAK)

Submitted to

Sachin Garg(HOD , COMPUTER SCIENCE)

Poonam sharma(Assistant professor)

BCA V Semester

ROLL NO.: 1240260235

Internship Duration

JUNE – JULY 2026

Month & Year of Submission

AUGUST – 2026

UNDER THE SUPERVISION OF

Ishwar

(Senior web developer
and mentor)

ACKNOWLEDGEMENT

I would like to express my heartfelt gratitude to everyone who supported and guided me throughout my 28-day industrial training and internship journey in Web Development.

This training has been a remarkable learning experience, helping me bridge the gap between theoretical knowledge and practical application. First and foremost, I am deeply thankful to my college management, mentors, and faculty members for providing me with this opportunity and encouraging me to undertake practical industrial training to enhance my technical skills.

PREFACE

This report is prepared as a formal documentation of my 28-day industrial training and internship in frontend web development, focusing on core technologies including HTML, CSS, JavaScript, and React.js.

In today's fast-growing digital world, practical exposure is just as important as classroom learning. While academic studies build our fundamental understanding, working on real-world projects bridges the gap between theory and industry requirements. This 28-day training program was designed to provide hands-on coding experience, helping me understand how modern websites and web applications are structured, styled, and made interactive.

Throughout this short yet intensive training period, I explored responsive web design, modern JavaScript concepts, and component-based architecture using React. I also learned how to manage code using Git and GitHub, debug effectively, and build user-friendly interfaces.

This report covers a detailed summary of my day-to-day learning, technical concepts explored, and practical projects developed during the 28 days. I hope this document reflects my dedication to learning web development and serves as a useful record of my practical journey.

Manish Baghel

OBJECTIVES OF INTERNSHIP:-

- **Gain Practical Experience**:
  Apply the coding concepts learned in books and classes to real websites and projects.

- **Build Web Pages**:
  Learn how to use HTML, CSS, and JavaScript to create clean, attractive, and responsive web pages.

- **Learn React.js:**
  Understand how to use the React framework to build modern web applications using components and hooks.

- **Manage Code**:
  Learn how to save, track, and upload code using Git and GitHub.

- **Improve Problem Solving:**
  Practice finding and fixing errors (bugs) while writing code.

- **Understand the Work Environment:**
  Gain real-world working experience by building projects under a developer's guidance.

TABLE OF CONTENTS

CHAPTER 1: INTRODUCTION

1.1 Overview of Web Development

1.2 Purpose and Objectives of the 28-Day Internship

1.3 Scope of Frontend Technologies (HTML, CSS, JavaScript, React)

CHAPTER 2: COMPANY / TRAINING PROFILE

2.1 About the Training Program

2.2 Roles and Responsibilities as a Web Development Trainee

2.3 Tools and Technologies Used (VS Code, Git, GitHub, Browser DevTools)

CHAPTER 3: CORE TECHNOLOGIES & THEORETICAL FOUNDATION

3.1 HTML5: Semantic Structure and Forms

3.2 CSS3: Flexbox, Grid, and Responsive Media Queries

3.3 JavaScript (ES6+): Variables, Functions, Arrays, and DOM Manipulation

3.4 React.js: Components, Props, State, and Hooks

CHAPTER 4: 28-DAY DAY-WISE TRAINING SCHEDULE

4.1 Week 1: HTML, CSS Fundamentals & Responsive Design (Days 1–7)

4.2 Week 2: JavaScript Essentials & DOM Interactivity (Days 8–14)

4.3 Week 3: Advanced JavaScript, APIs & Introduction to React (Days 15–21)

4.4 Week 4: React Components, State Management & Final Project (Days 22–28)

CHAPTER 5: PRACTICAL PROJECTS & IMPLEMENTATION

5.1 Project 1: Responsive Landing Page (HTML & CSs

5.2 Project 2: Interactive Task / To-Do App (JavaScript)

5.3 Project 3: Dynamic Weather / Product Dashboard (React & API Integration)

CHAPTER 6: LEARNING OUTCOMES & CHALLENGES FACED

6.1 Technical Skills Acquired

6.2 Common Debugging Challenges and Solutions

6.3 Soft Skills and Time Management

CHAPTER 7: CONCLUSION & FUTURE SCOPE

7.1 Conclusion of the 28-Day Journey

7.2 Future Career Roadmap in Frontend Development

CHAPTER 1 :-

INTRODUCTION

- **ABOUT CREATIVE DEVELOPERS**
- **ABOUT THE INTERNSHIP**
- **ABOUT DATA ANALYTICS**

Chapter 1: Introduction to Training

1.1 Overview of Frontend Development

- Frontend development involves building the visual parts of websites and web applications that users directly interact with. During my 28-day training, I focused on learning how web pages are structured, styled, made interactive, and built into scalable applications.

1.2 Objectives of the 28-Day Program

- Understand website layout creation using HTML5 tags.
- Learn CSS styling principles for making sites look good across all screens.
- Gain hands-on knowledge of JavaScript for handling user interactions and dynamic logic.
- Master React.js to build modern, component-based user interfaces.
- Complete a live practice project to understand real-world workflows.

Chapter 1: Introduction (Contd.)

1.3 Daily Routine and Workflow

The 28-day internship was divided into structured learning phases. Each day began with a briefing on core concepts, followed by hands-on coding exercises, debugging practice, and building mini-features.

1.4 Development Tools Used

- **Visual Studio Code (VS Code):**
- Primary code editor used for writing
- HTML, CSS, js and React code.

Google Chrome Developer Tools:

Used for inspecting elements, checking CSS styles, and debugging JavaScript console logs.

Git & GitHub:

Used for tracking code changes and saving projects online.

Chapter 1: Introduction (Contd.)

1.5 Why HTML, CSS, JS & React Stack?

This stack forms the backbone of the modern web ecosystem. HTML provides content structure, CSS adds visual presentation, JavaScript provides logic, and React enables fast, reusable user interface components.

The 28-day duration allowed me to transition from basic static pages to building dynamic single-page applications efficiently.

Chapter 2: Week 1 - HTML5 Fundamentals

2.1 Day 1 to Day 3: Document Setup & Basic Tags

The first three days focused on understanding how web browsers interpret text and tags. I learned about basic document setup, headings (`<h1>` to `<h6>`), paragraphs (`<p>`), and lists (`<ul>`, `<ol>`).

2.2 Links, Images, and Tables

During the next phase of Week 1, I practiced linking multiple pages using anchor tags (`<a href="...">`), embedding images (`<img src="..." alt="...">`), and structuring tabular data using HTML tables (`<table>`, `<tr>`, `<th>`, `<td>`).

2.3 Forms and User Input

Building user registration and login forms is a key part of web development. I practiced using form elements like text inputs, password fields, radio buttons, checkboxes, and submit buttons.

2.4 Day 4 to Day 7: Semantic Tags and Accessibility

In the latter half of the first week, I learned about semantic tags such as `<header>`, `<nav>`, `<main>`,

`<section>`, `<article>`, and `<footer>`. Using these tags instead of generic `<div>` elements makes code cleaner and easier for search engines and screen readers to read.

I completed a small personal portfolio skeleton using only HTML semantic tags during Day 7.

Chapter 2: Week 1 Summary

By the end of Week 1, I had a clear understanding of HTML document layout, form handling, and semantic elements. This laid a strong foundation for styling pages with CSS in Week 2.

Chapter 2: Week 1 Review & Transition

Reviewing Week 1 tasks helped me identify minor errors in closing tags and attribute naming. Moving into Week 2, the focus shifted entirely towards presenting these raw HTML elements attractively using CSS3.

Chapter 2: Week 1 Conclusion

Week 1 concluded with peer code reviews where we verified document structures and proper indentation practices.

Chapter 3: Week 2 - CSS3 Styling

3.1 Day 8 to Day 10: Box Model and Selectors

Week 2 started with Cascading Style Sheets (CSS3). I learned how to link stylesheets and use selectors (class, ID, element selectors). I also studied the CSS Box Model, which consists of content, padding, border, and margin.

3.2 Colors, Fonts, and Text Styling

I learned how to apply background colors, gradients, font families, line heights, and text alignments to improve readability across web pages.

3.3 Positioning and Display Properties

I practiced CSS display properties (`block`, `inline`, `inline-block`, `none`) and positioning types (`static`, `relative`, `absolute`, `fixed`) to control element placement on screens.

3.4 Day 11 to Day 14: Flexbox and Grid Layouts

Modern layouts require flexible alignment tools. I learned Flexbox for one-dimensional layouts (rows and columns) and CSS Grid for two-dimensional layouts.

3.5 Responsive Design & Media Queries

Websites must look good on mobile phones, tablets, and desktop computers. I used media queries (`@media (max-width: 768px)`) to adjust font sizes and stack layouts on smaller screens.

Chapter 3: Week 2 Summary

Week 2 equipped me with the skills to design responsive web pages that adapt smoothly to different device screen sizes.

Chapter 3: Week 2 Review

Practicing flexbox alignment exercises resolved common centering issues I previously faced with margins.

Chapter 3: Week 2 Conclusion

Completed styled landing page project with responsive navigation bar and responsive grid cards.

Chapter 4: Week 3 - JavaScript Core

4.1 Day 15 to Day 18: ES6 Syntax and Functions

Week 3 focused on JavaScript to add interactive logic to web pages. I learned modern ES6 features including `let` and `const`, template literals, and arrow functions.

4.2 Arrays and Objects Manipulation

I practiced working with JavaScript objects and arrays, using built-in methods like `map()`, `filter()`, and `reduce()` to transform data efficiently.

4.3 Conditionals and Loops

I reviewed conditional statements (`if`, `else`, ternary operators) and loops (`for`, `while`, `forEach`) for decisionmaking and repetitive tasks in code.

4.4 Scope and Closures

I explored variable scope (global vs. block scope) and closures in JavaScript to understand how functions retain access to outer variables.

4.5 Day 19 to Day 21: DOM Manipulation & Events

Connecting JavaScript to HTML via the Document Object Model (DOM) allowed me to select elements using `getElementById` and `querySelector`, and change their content dynamically.

4.6 Asynchronous JavaScript & Fetch API

I learned how to fetch data from external servers using Promises and `async/await` syntax, displaying live data inside web pages.

```
const loadData = async () => { const res = await fetch('https://api.github.com/users');

const data = await res.json(); console.log(data); };
```

Chapter 4: Week 3 Summary

Week 3 strengthened my programming logic, enabling me to build interactive widgets like calculators, to-do lists, and weather checkers using vanilla JavaScript.

Chapter 4: Week 3 Review

Debugging asynchronous API calls using browser developer network tabs became smooth and natural.

Chapter 4: Week 3 Conclusion

=>Ready for component-based architecture in React.

Chapter 5: Week 4 - React.js Basics

5.1 Day 22 to Day 25: Components and JSX

Week 4 introduced React.js, a library for building user interfaces using reusable components. Instead of manipulating the DOM manually, React uses JSX and a Virtual DOM for efficient updates.

5.2 Props in React

I learned how to pass data between components using `props`, allowing dynamic rendering of reusable UI blocks.

5.3 State Management with `useState`

Components need to remember data changes. The `useState` hook allows functional components to maintain state variables.

5.4 Handling Side Effects with `useEffect`

The `useEffect` hook was used for handling side effects like data fetching and document title updates when component states change.

5.5 Event Handling in React

Handling button clicks and input changes in React uses camelCase event names like `onClick` and `onChange`.

5.6 Conditional Rendering

I learned how to render components conditionally using JavaScript logical `&&` operators and ternary conditions.

5.7 Day 26 to Day 28: Capstone Project

For the final three days of the 28-day program, I built a capstone project using React: a Task Management / Product Store application featuring component structure, state management, and API calls.

5.8 Project Structure and Organization

Organizing components into separate folders (`/components`, `/pages`) helped maintain clean project architecture.

5.9 Version Control with Git

I practiced saving code checkpoints using Git commands (`git add`, `git commit`, `git push`) and pushing projects to GitHub.

5.10 Deployment on Vercel / Netlify

The final project was successfully deployed live onto Vercel, allowing anyone to access the application via a public URL.

Chapter 5: Week 4 Summary

Building a complete React application in Week 4 tied together all concepts learned from HTML, CSS, and JavaScript.

Chapter 6: Conclusion

My 28-day industrial training program in Frontend Web Development was an invaluable learning experience. Moving from basic HTML tags to building reactive single-page applications with React has given me practical confidence.

I am now ready to apply for frontend developer and React internship roles in the software industry.

Appendix: Key Learnings Summary

HTML5:

- Semantic elements and accessible forms.

CSS3:

- Flexbox, Grid, and responsive media queries.

JavaScript:

- ES6 arrow functions, array methods, and async/await.

React.js:

- Components, props, useState, and useEffect hooks.

Final Acknowledgment

I would like to express my sincere gratitude to my mentors, trainers, and institute guides for providing guidance and support throughout this 28-day practical training program.
